

Kodak Cinelabs Greece expansion

Kodak Cinelabs Greece has expanded its print operation while ensuring its print quality by employing Kodak ECP kit chemistry.

Kodak Cinelabs Greece (KCG) has recently relocated its lab operation into a more central location in Athens. Now just 20 minutes from the airport, the newly refurbished premises is designed and equipped with the very latest technology in printing and processing equipment. KCG will now be able to handle considerably higher volumes than at its previous location.

With print quality at the centre of its core business, KCG uses KODAK's ECP-2D Kit Chemicals. The new design kit chemical packaging is far more robust and has made transporting and storage of the solutions much better for the lab. Also, where space is at a premium, mixing areas can be radically redesigned using the very minimum of space as the chemistry is pre-packaged and ready to use virtually eliminating any chance of mix error.

Antonio Rasura, Cinelabs Operations Manager, said, "The standard of Kodak kit chemicals allows the lab to focus its attention on other critical departments because consistency and stability of these solutions are so carefully monitored by Kodak."

Among the many services offered by the newly-refurbished KCG are:

- **Color negative processing for 35mm and 16mm**
- **Release Printing Service**
- **B&W Neg and Print**
- **Sound Recording**
- **Digital intermediate film recording**
- **Digital Post Production Service**
